Outline

- 1 Introduction
 - Review of CBC mode
 - Padding oracle attack
- 2 Basic PO attacks
 - POET vs CAPTCHA
 - POET vs JavaServer Faces
- 3 Advanced PO attacks
 - Distributed cross-site PO attacks
 - Using PO to encrypt
- 4 0-day: POET vs ASP.NET
 - ASP.NET's design problems
 - Padding oracles in ASP.NET

CBC Mode

- CBC mode is a cryptography mode of operation for a block cipher.
- Allows encryption of arbitrary length data.
- Encryption and decryption are defined by:

$$C_i = e_K(P_i \oplus C_{i-1})$$

$$P_i = d_K(C_i) \oplus C_{i-1}$$

CBC Mode

Typical block size n :
64 bits (DES, triple
DES) or 128 bits
(AES).

Typical key size:
56 bits (DES), 168 bits
(triple DES), 128, 192
or 256 bits (AES).

Padding

H	e	l	l	o		w	o
---	---	---	---	---	--	---	---

11 bytes of plaintext

r	l	d					
---	---	---	--	--	--	--	--

PKCS5 Padding

---	---	---	---	---	--	---	---

r	l	d	05	05	05	05	05
---	---	---	----	----	----	----	----

Encryption

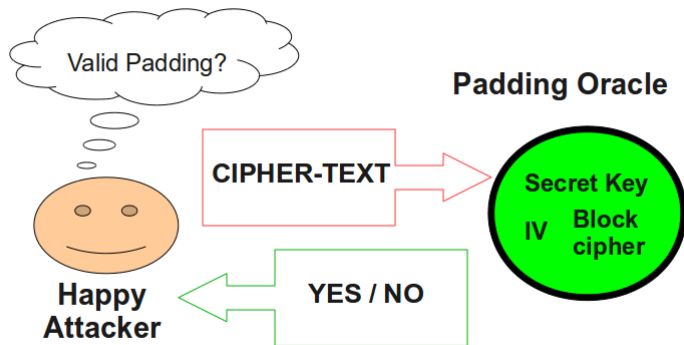

Padding oracle attack

Introduction

- First introduced by Vaudenay at Eurocrypt 2002.
- Two assumptions:
 - Adversary can intercept padded messages encrypted in CBC mode.
 - Adversary has access to a padding oracle.

Padding oracle attack

What is a padding oracle?

Padding oracle attack

What is a padding oracle?

- Adversary submits a CBC mode ciphertext C to oracle \mathcal{O} .
- Oracle decrypts under fixed key K and checks correctness of padding.
- Oracle outputs VALID or INVALID according to correctness of padding:

$$\mathcal{O}(C) = \begin{cases} 0, & \text{invalid} \\ 1, & \text{valid} \end{cases}$$

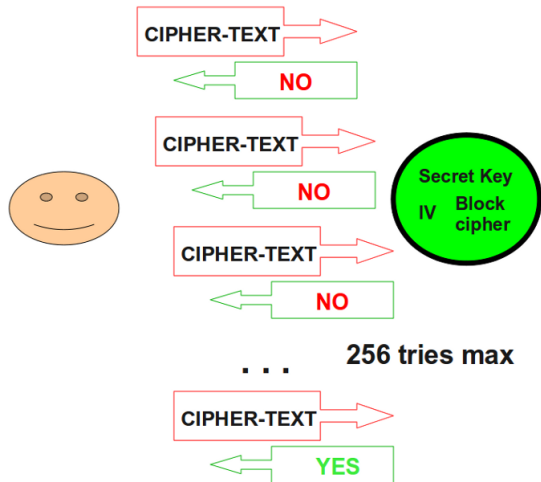

Padding oracle attack

How does it work?

- For a long message, decrypt block by block. It's easy to parallelize the attack.
- For a block, decrypt the last byte first, then decrypt the next to last byte, and so on.
- How?

Padding oracle attack

How to decrypt a block

Padding oracle attack

Last byte decryption algorithm

Last byte decryption algorithm

- pick a few random bytes r_1, \dots, r_b , and take $i = 0$.
 - pick $r = r_1 r_2 \dots r_{b-1} (r_b \oplus i)$.
 - if $\delta(r|y) = 0$ then increment i and go back to previous step.
 - replace r_b by $r_b \oplus i$.
- for $n = b$ down to 2
 - ① take $r = r_1 \dots r_{b-n} (r_{b-n+1} \oplus 1) r_{b-n+2} \dots r_b$
 - ② if $\delta(r|y) = 0$ then stop and output $(r_{b-n+1} \oplus n) \dots (r_b \oplus n)$
- output $r_b \oplus 1$.

POET vs CAPTCHA

A broken CAPTCHA system

- $ERC = e_{K,IV}(rand())$.
 -
 - ERC is stored as either a hidden field or a cookie in the CAPTCHA form.
 - Once a user submits, the server decrypts ERC , and compares it with the code that the user has entered. If equal, the server accepts the request; it denies the request otherwise.

POET vs CAPTCHA

Bypass the broken CAPTCHA system

- Since the system decrypts any *ERC* sent to it, it is vulnerable to Padding Oracle attack.
- The only remaining problem now is to know when padding is *VALID*, and when it's not.
- Fortunately, most CAPTCHA systems would send back an error notification when they fail to decrypt *ERC*, i.e. padding is *INVALID*.
- In addition, when we modify *ERC* so that the padding is *VALID*, most systems would display an image with a broken code.
- Now we have a padding oracle, and we can use it to decrypt any *ERC*, thus bypass the CAPTCHA completely.

POET vs JavaServer Faces

Introduction

- JavaServer Faces (JSF) is a popular Java-based standard for building server-side user interfaces.
- Like ASP.NET, JSF stores the state of the view in a hidden field.
- Although JSF specification advises that view state should be encrypted and tamper evident, but no implementation follows that advice.
- In other words, we can use padding oracle attacks to decrypt the view states of most JSF frameworks.

POET vs JavaServer Faces

Padding oracle in JSF frameworks

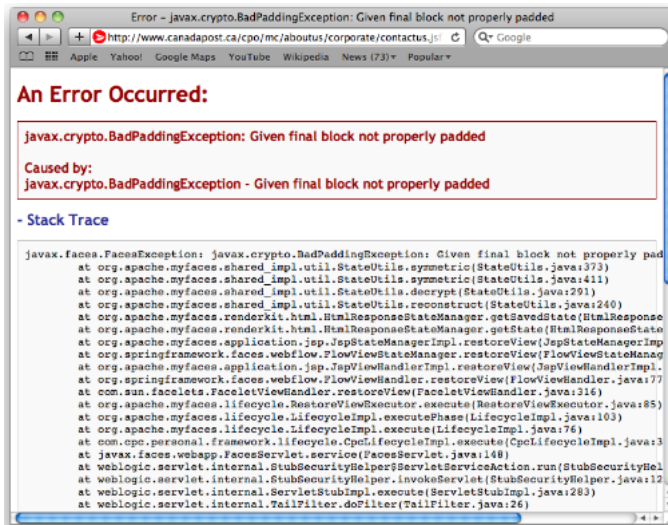

- By default, all JSF frameworks would display a very detailed error message if it fails to decrypt a view state.

Padding oracle in default installations of JSF frameworks

- if we see `javax.crypto.BadPaddingException`, then it's INVALID padding
 - it's VALID padding otherwise.

POET vs JavaServer Faces

Apache MyFaces error-page

The screenshot shows a web browser window with the title "Error - javax.crypto.BadPaddingException: Given final block not properly padded". The address bar shows the URL "http://www.canadapost.ca/cpo/mc/aboutus/corporate/contactus.jsf". The main content of the page is as follows:

An Error Occurred:

javax.crypto.BadPaddingException: Given final block not properly padded

Caused by:
javax.crypto.BadPaddingException - Given final block not properly padded

- Stack Trace

POET vs JavaServer Faces

Padding Oracle in JSF frameworks

- Most JSF frameworks allow developers to turn off error messages. Then we can use the following simple trick:

Padding oracle in JSF frameworks when error-page is turned off

- Say we want to decrypt block C_i of an encrypted view state $C_0|C_1|\dots|C_{n-1}$, then we send $C_0|C_1|\dots|C_{n-1}|C_{random}|C_i$ to the target.
 - Since Java ignores those extra blocks while decrypting and deserializing view states, it's VALID padding if the target returns the same page as when the view state is unaltered.
 - And it's probably INVALID padding if we see something else, e.g. a HTTP 500 error message.

Demo

POET vs Apache MyFaces

- Apache MyFaces latest version.
- This also works with SUN Mojarra and probably other JSF implementations.

Distributed cross-site PO attacks

- Only a single bit of information is necessary to exploit a padding oracle.
- Cross-domain information leakage bugs in web browsers can help.
- One example: `` + `onerror()/onload()` events.
- `onLoad()` called: VALID padding; `onError()` called: INVALID padding.

Distributed cross-site PO attacks

- We've been able to exploit CAPTCHA schemes using a single Javascript program running in the local browser
- Creating a distributed attack is as simple as injecting javascript code into popular websites.
- Distributed attacks allows easy creation of code books.

Demo

Distributed cross-site PO attacks

- Cracking CAPTCHA using Javascript running locally.
- Target: <http://www.bidz.com>.

Using PO to encrypt

An introduction to CBC-R

- CBC-R turns a decryption oracle into an encryption oracle.
- We all know that CBC decryption works as following:

$$P_i = d_K(C_i) \oplus C_{i-1}$$

$$C_0 = IV$$

- We can use a padding oracle to get $d_K(C_i)$, and we control C_{i-1} . In other words, we can produce any P_i as we want.

Using PO to encrypt

How CBC-R works

CBC-R pseudocode

- choose a plaintext message $P_0|...|P_{n-1}$ that you want to encrypt.
 - pick a random C_{n-1} .
 - for $i = n - 1$ down to 1: $C_{i-1} = P_i \oplus d_{\delta}(C_i)$
 - $IV = P_0 \oplus d_{\delta}(C_0)$
 - output $IV|C_0|C_1|...|C_{n-1}$. This ciphertext would be decrypted to $P_0|...|P_{n-1}$.

Using PO to encrypt

CBC-R Without Controlling IV

- CBC-R allows us to encrypt any message, but if we cannot set the IV , then first plaintext block P_0 will be random and meaningless.
- If the victim expects the decrypted message to start with a standard header, then it will ignore the forged message constructed by CBC-R.
- We have not found generic way to overcome this limitation. However, we have found workarounds for particular cases.

Using PO to encrypt

CBC-R Without Controlling IV

Using captured ciphertexts as prefix

- $P_{valid} = d_K(C_{captured} | IV_{CBC-R} | P_{CBC-R})$.
 - The block at the position of IV_{CBC-R} is still garbled.
 - We can make the garbled block becomes part of some string that doesn't affect the semantic of the message such as comment or textbox label.

Using PO to encrypt

CBC-R Without Controlling IV

Brute-forcing C_0

- CBC-R can produce many different ciphertexts that decrypted to the same plaintext block chain P_{n-1}, \dots, P_1 . The only difference is the first plaintext block which is computed as following:

$$P_0 = d_K(C_0) \oplus IV$$

- A valid header means that the first few bytes of P_0 must match some magic numbers. There are also systems that accept a message if the first byte of its P_0 matches its size.
- If this is the case, and if the message is short enough, we can try our luck by brute-forcing C_0 .

Using PO to encrypt

CBC-R Applications

sudo make me a CAPCHA

CBC-R Applications

Creating malicious JSF view states

- Which view states to create?
 - How to solve the garbled block problem?

ASP.NET's design problems

Web.config (We steal this slide from Paul Craig)

- The Golden Rule of Web Security: “Do not keep anything sensitive inside the document root.”
- Web.config is the most important and sensitive file in ASP.NET.
- Guess what? It's just a normal file inside the document root!
 - Usernames, passwords, connection strings.
 - MachineKey: validationKey (HMAC key) and decryptionKey (DES, 3DES, or AES key).
 - A lot of configuration information.
- All it takes is one file disclose vulnerability.

ASP.NET's design problems

Cryptography

- MAC-then-Encrypt -> Decrypt-then-Verify -> still leak padding validity information.
- Crypto API does not authenticate messages by default -> there are some encryptions w/o using MAC at all.
- Fixed known IV.
- MachineKeyCompatibilityMode.Framework20SP2.
- Same keys use to encrypt a lot of different things -> one padding oracle leads to full compromise.
- No easy way to generate keys:
 - People don't change keys during the lifetime of applications.
 - People don't change default keys in downloaded applications.
 - People even generate keys using online tools.

Padding oracles in ASP.NET

MAC-then-Encrypt: FAILED

- ASP.NET MAC-then-Encrypt these things:
 - ViewState.
 - Form Authentication Tickets.
 - Anonymous Identification.
 - Role Cookies.
- In other words, universal padding oracles in every ASP.NET application!

Padding oracles in ASP.NET

No MAC at all: EPIC FAILED

- ASP.NET does not use MAC at all when encrypting:
 - WebResource
- Even better universal padding oracle!

Padding oracles in ASP.NET

How to detect padding oracles in ASP.NET

- Nice error messages, often turned on by default.
- No error message? Nice HTTP response statuses.
- Always the same 404 status? Nice timing information.

DEMO

POET vs ASP.NET

- 0-day: works for the latest versions of ASP.NET.
- Target application: DotNetNuke (over 600,000 public installations).
- POET -> remote code execution -> Cesar's Token Kidnapping -> ROOT privilege on Windows.

What happened?

- This line is worth the price of admission: we found a way to read arbitrary files using CBC-R!
- You may need to optimize your CBC-R attack. Full paper and tools will be released soon!

Summary

- Padding oracle attacks allow one to decrypt ciphertext without knowing the key.
- We can use padding oracle attacks to crack CAPTCHA, and decrypt JSF view state, etc.
- Distributed cross-site padding oracle attacks allow one to distributively build a code book to map all ciphertexts to corresponding plaintexts.
- CBC-R turns a decryption oracle into an encryption oracle, and allow us to destroy ASP.NET security.
